The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on LED Bulb Raw Material competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. LED bulbs are composed of several key raw materials. The most important one is the semiconductor chip, which is usually made of gallium nitride (GaN) or other compound semiconductors. This chip is the core component that emits light when an electric current passes through. Another essential material is the phosphor, which is used to convert the ultraviolet or blue light from the chip into white light. Different phosphors can be mixed to achieve different color temperatures and spectral characteristics. The bulb's housing is typically made of plastic or glass, which provides protection and insulation for the internal components. Plastic is lightweight and cost-effective, while glass offers better heat dissipation and optical properties. The metal base, usually made of copper or aluminum, is used for electrical connection and heat dissipation. Copper has good electrical conductivity, and aluminum has excellent heat-dissipating capabilities. Additionally, various conductive wires and soldering materials are used to connect the different components together, ensuring the smooth flow of electricity within the LED bulb.

The global LED Bulb Raw Material market size was estimated at USD 2781.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
