Report Overview

LED Distance Measuring Sensors are electronic devices designed to measure the distance between the sensor and an object or surface by emitting light in the form of light-emitting diodes (LEDs). These sensors work on the principle of time-of-flight (ToF), where they emit a pulse of light and measure the time it takes for the light to bounce back after hitting an object. The distance is then calculated using the speed of light and the time duration. These sensors are widely used in various applications such as robotics, automation, and industrial processes for precise distance measurement, obstacle detection, and collision avoidance. They offer advantages such as high accuracy, fast response time, and low power consumption, making them suitable for a wide range of applications where precise distance measurement is required.
