Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on LED Lamp Aluminum Substrate competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. An LED lamp aluminum substrate is a specialized printed circuit board (PCB) that uses aluminum as the base material to provide excellent heat dissipation for high-power LED applications. Unlike standard FR-4 boards, aluminum substrates consist of a three-layer structure: a copper circuit layer, a thermally conductive dielectric layer, and an aluminum base layer. This construction allows heat generated by the LED chips to quickly transfer away from the components, enhancing performance and extending lifespan. These substrates are widely used in LED lighting systems such as bulb lamps, floodlights, automotive headlights, and streetlights. They offer advantages including thermal conductivity, mechanical strength, and lightweight design. Some advanced aluminum PCBs also support multi-layer designs or integration with MCPCBs (Metal Core PCBs) for higher heat load applications.

The global LED Lamp Aluminum Substrate market size was estimated at USD 1163.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
