Abstracts

The market for LED phosphor materials encompasses the production, distribution, and application of inorganic luminescent compounds that are essential for converting the blue or ultraviolet light emitted by semiconductor chips in light-emitting diodes (LEDs) into a broad spectrum of visible light, enabling the creation of white and colored LED lighting solutions. These materials, typically composed of rare-earth-doped host matrices such as yttrium aluminum garnet (YAG) doped with cerium or nitridosilicates doped with europium, are critical for determining key performance characteristics of LED devices, including color rendering index (CRI), correlated color temperature (CCT), luminous efficacy, and long-term stability. The market is driven by demand across general illumination, automotive lighting, backlighting for displays, horticultural lighting, and other specialized applications, with innovation focused on improving efficiency, thermal stability, color quality, and reducing dependence on critical raw materials. Regulatory trends emphasizing energy efficiency and the phase-out of traditional lighting technologies further bolster adoption, while competition centers on material composition patents, manufacturing scalability, cost-effectiveness, and compatibility with evolving LED chip technologies.

The global Led Phosphor Materials market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
