Abstracts

LED Photodynamic Therapy (PDT) Device is a medical apparatus that employs light-emitting diodes (LEDs) to emit precise wavelengths of light (commonly within the visible or near-infrared spectrum) to activate photosensitizing agents applied to targeted tissues. This interaction generates reactive oxygen species (ROS), which selectively destroy abnormal cells—such as cancerous growths, infected tissues, or acne-causing bacteria—while preserving surrounding healthy structures. The device integrates customizable parameters (e.g., wavelength selection, light intensity, treatment duration), safety mechanisms (temperature regulation, real-time monitoring), and user interfaces for controlled therapy delivery. Clinically utilized in dermatology (e.g., treating actinic keratosis, psoriasis), oncology, and aesthetic medicine, LED-PDT offers a minimally invasive, targeted approach with enhanced precision and reduced systemic side effects compared to traditional treatments.

The global LED Photodynamic Therapy Device market size was estimated at USD 425.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.30% during the forecast period.
