Abstracts

An LED Receiving Card, also known as an LED receiver card or LED control card, is a critical component of an LED display system, particularly in large LED video walls and signage installations. The primary function of an LED Receiving Card is to receive and process data, including video, image, and other content, from a video source, and then transmit this data to the individual LED display modules or tiles that make up the LED screen. LED Receiving Cards play a pivotal role in ensuring that content is properly displayed on the LED screen in a coordinated and synchronized manner.

Increasing Demand for Fine Pixel Pitch (FPP) Displays: The demand for LED displays with fine pixel pitch, which offer higher resolution and image quality, is on the rise. This trend drives the need for advanced LED Receiving Cards that can process and control the data for these high-resolution displays.

HDR and Wider Color Gamut: High Dynamic Range (HDR) technology, which enhances the contrast and color depth of LED displays, is becoming more popular. LED Receiving Cards are adapting to support HDR content and the wider color gamut associated with it.

Remote Management and Monitoring: With the growth of the Internet of Things (IoT), LED Receiving Cards are incorporating remote management and monitoring features, allowing users to control and monitor LED displays from a central location. This is particularly important for large installations and 24/7 operation.

Interactive Displays and Touchscreen Applications: Interactive LED displays and touchscreen applications are gaining popularity in various sectors, such as education, retail, and corporate settings. LED Receiving Cards may need to support touch and gesture controls.

The global LED Receiving Card market size was estimated at USD 1495.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
