### Report Overview:

A light-emitting diode (LED) is a two-lead semiconductor light source. It is a p–n junction diode that emits light when activated. When a suitable current is applied to the leads, electrons are able to recombine with electron holes within the device, releasing energy in the form of photons. This effect is called electroluminescence, and the colour of the light (corresponding to the energy of the photon) is determined by the energy band gap of the semiconductor. LEDs are typically small (less than 1 mm<sup>2</sup>) and integrated optical components may be used to shape the radiation pattern.

The Global LED Traffic Signs and Signals Market Size was estimated at USD 1016.16 million in 2023 and is projected to reach USD 1249.12 million by 2029, exhibiting a CAGR of 3.50% during the forecast period.
