Abstracts

The lens-type under-screen fingerprint sensor achieves high-precision fingerprint image capture by integrating a micro lens and light source under the screen. This sensor uses a lens system to focus the optical image of the user's finger onto a high-resolution image sensor, and can accurately obtain fingerprint details even when the screen is lit. When the user touches the designated area of the screen with his finger, the OLED light-emitting layer at the bottom of the screen illuminates the fingerprint, and the lens captures and transmits the image to the processing unit for comparison and verification.

The global Lens Type Under Screen Fingerprint Sensors market size was estimated at USD 2125.32 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
