Abstracts

A Lentivirus Packaging Service is a specialized biotechnology service that focuses on the production of infectious lentiviral vectors. This process typically involves the use of packaging cell lines, often engineered mammalian cells like 293T cells. These cells are transfected with multiple plasmids: a transfer plasmid containing the gene of interest flanked by lentiviral long - terminal repeats (LTRs), a packaging plasmid encoding the structural and enzymatic proteins (gag, pol) required for virion assembly, and an envelope plasmid that provides the envelope protein, which can be from a heterologous virus for pseudotyping. Through these transfections, the cells produce lentiviral particles that encapsulate the genetic cargo from the transfer plasmid. The service includes strict quality control measures, such as determining the virus titer (the concentration of infectious particles) and ensuring vector purity, to provide researchers and clinicians with high - quality lentiviral vectors suitable for applications like gene therapy, where stable gene integration into target cells is crucial, and basic research to study gene function and regulation.

The global Lentivirus Packaging Service market size was estimated at USD 382.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
