Abstracts

Less layer graphene oxide (LGO) refers to a form of graphene oxide with a reduced number of stacked layers, typically fewer than five, resulting in enhanced material properties such as higher surface area, improved colloidal stability, and greater reactivity compared to multilayer or bulk graphene oxide. This material is synthesized through modified oxidation and exfoliation techniques that minimize layer restacking, preserving the two-dimensional characteristics critical for applications in electronics, energy storage, composites, and biomedical devices. The reduced layer count facilitates better dispersion in solvents and polymers, enables more efficient functionalization, and often leads to superior electrical, mechanical, and barrier properties when integrated into end products.

The global Less Layer Graphene Oxide market size was estimated at USD 320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 22.40% during the forecast period.
