Abstracts

Leucovorin calcium injection is a pharmaceutical preparation that serves as a calcium salt of leucovorin, a reduced form of folic acid, primarily used to counteract the toxic effects of folic acid antagonists like methotrexate in high-dose chemotherapy regimens. It acts as a "rescue" agent by providing an active form of folate that bypasses the metabolic blockade induced by these drugs, thereby protecting healthy cells from damage while allowing cancer cells to remain vulnerable. Additionally, it is utilized in the treatment of megaloblastic anemias due to folic acid deficiency when oral therapy is not feasible and as an adjunct to enhance the efficacy and modulate the toxicity of fluorouracil in colorectal cancer chemotherapy. Its injectable form ensures rapid and reliable systemic absorption, making it critical in clinical settings where precise dosing and immediate bioavailability are required.

The global Leucovorin Calcium Injection market size was estimated at USD 250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
