## Abstracts

Leukemia targeted therapy drugs are specialized medications designed to treat leukemia by specifically targeting the molecular and genetic abnormalities that drive the growth of cancer cells. Unlike traditional chemotherapy, which affects both healthy and cancerous cells, targeted therapies focus on mechanisms such as inhibiting tyrosine kinases, blocking abnormal protein functions, or interfering with the cancer cell's ability to grow and divide. Common drugs include tyrosine kinase inhibitors like imatinib for chronic myeloid leukemia (CML) and monoclonal antibodies targeting specific leukemia markers. These therapies improve treatment outcomes by offering greater precision, fewer side effects, and enhanced efficacy, especially in patients with specific genetic mutations or biomarkers.

The global Leukemia Targeted Therapy Drugs market size was estimated at USD 4378.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
