Report Overview

The induction suspension melting furnace adopts the principle of electromagnetic induction and water-cooled copper crucible to melt the melted material, and the melting charge is in a suspended state under the action of electric power. The advantage is that the contamination of the crucible to the material is minimized. The water-cooled copper crucible is made of high-purity oxygen-free copper, especially for some materials that react strongly with the crucible (such as titanium and its alloys). . It has been widely used in the casting of titanium, zirconium and its alloys.

The global Levitation Induction Melting Furnac market size was estimated at USD 315.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
