Abstracts

Levocarnitine for injection is a pharmaceutical formulation of L-carnitine, a naturally occurring amino acid derivative essential for mitochondrial fatty acid oxidation. It functions as a critical cofactor in the transport of long-chain fatty acids into the mitochondrial matrix, where they undergo beta-oxidation to produce cellular energy in the form of ATP. This injectable preparation is indicated for the acute and chronic treatment of carnitine deficiency, which may arise from inborn errors of metabolism, end-stage renal disease requiring dialysis, or iatrogenic causes such as valproic acid therapy. Available as a sterile solution typically administered intravenously or intramuscularly, it addresses conditions where oral supplementation is insufficient or impractical due to impaired absorption, severe metabolic crises, or clinical urgency. The product is classified as a prescription drug and must meet stringent regulatory standards for purity, sterility, and stability, given its parenteral route of administration.

The global Levocarnitine For Injection market size was estimated at USD 102.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
