Abstracts

Li Ion Hard Carbon Material refers to a class of amorphous carbon-based anode materials used in lithium-ion batteries, characterized by a disordered, non-graphitic structure with a significant proportion of closed micropores and a high degree of cross-linking. Unlike graphite anodes, which rely on intercalation, hard carbon materials primarily store lithium ions through adsorption on internal surfaces and within nanopores, enabling higher specific capacities, particularly in the low-voltage plateau region, and improved rate performance. This material is especially valued for its compatibility with sodium-ion batteries and its ability to enhance the energy density, cycle life, and safety of next-generation energy storage systems, making it a critical component in advancing applications such as electric vehicles, grid storage, and portable electronics.

The global Li Ion Hard Carbon Material market size was estimated at USD 1250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
