Abstracts

Lithium-ion battery positive electrode conductive additive, also known as positive electrode conductive agent, is a key auxiliary material in lithium-ion batteries. Its main function is to form a conductive network to improve the conductivity between the active substance of the electrode material and the current collector, thereby improving the conductivity, capacity, rate performance and cycle performance of the battery. With the global emphasis on environmental protection and sustainable development, the electric vehicle market has ushered in explosive growth. The increasing demand for high-performance lithium batteries in electric vehicles has promoted the expansion of the positive electrode conductive additive market. With the popularization of renewable energy and the construction of smart grids, the demand for energy storage systems is also increasing. The energy storage system has high performance requirements for lithium batteries, so the application of positive electrode conductive additives in energy storage systems is gradually expanding. With the development of mobile communications and electronic equipment, consumers' demand for high-performance and long-lasting 3C electronic products is increasing. This has prompted the continuous upgrading of lithium-ion battery technology and the expansion of the positive electrode conductive additive market.
