Abstracts

Phosphor is a substance that displays the property of luminescence. In the case of LED lighting the type of luminescence is specifically fluorescence, the emission of light caused by the absorption of blue light energy emanating from the LED chip. When a phosphor absorbs a photon of blue light it emits a photon of longer wavelength, extending the spectrum toward the red. Different phosphors have different emission characteristics and thus when combined with the blue light and each other, a high quality light spectrum is produced.

The global Light Emitting Diode Led Phosphor market size was estimated at USD 1643.38 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 16.10% during the forecast period.
