### Report Overview:

Phosphor is a substance that displays the property of luminescence. In the case of LED lighting the type of luminescence is specifically fluorescence, the emission of light caused by the absorption of blue light energy emanating from the LED chip. When a phosphor absorbs a photon of blue light it emits a photon of longer wavelength, extending the spectrum toward the red. Different phosphors have different emission characteristics and thus when combined with the blue light and each other, a high quality light spectrum is produced.

The Global Light Emitting Diode (LED) Phosphor Market Size was estimated at USD 1441.68 million in 2023 and is projected to reach USD 3530.70 million by 2029, exhibiting a CAGR of 16.10% during the forecast period.
