## Abstracts

Light guide film is a thin film light transmission structure that converts LED point light source into surface light source, thereby realizing light emission in a specified area. It has the advantages of low cost and low energy consumption. The surface of the light guide film has a precise optical microstructure, which transmits light by using optical principles such as refraction and reflection of light in the medium. The main material of the light guide film is optical grade PC film, which has the advantages of high tensile strength, high bending strength, high compression strength and light stability. The light guide film is light, soft, thin, physically stable and wear-resistant. Its structure itself has no special requirements for the circuit part and can be combined with metal film switches and FPC. In addition, the light guide film has a good luminous effect, more uniform brightness, high light intensity and saves power consumption. Light Guide Film (LGF) is an emerging optical material that is widely used in liquid crystal displays (LCDs), backlight sources and various lighting equipment. With the continuous advancement of science and technology and changes in market demand, the market status and future development trends of LGF present a diversified development situation. At present, the LGF market is in a growth stage, mainly benefiting from the popularization of consumer electronic products and the promotion of smart devices. Especially in terminal devices such as TVs, mobile phones, and tablets, the application of LGF can effectively improve light efficiency, improve display effects, and enhance user experience. In addition, with the advancement of LED lighting technology, LGF has also been increasingly used in the lighting field, promoting the further expansion of its market. In terms of future development trends, technological innovation of LGF will be the main driving force. With the continuous development of nanotechnology, thin film technology and new materials, the performance of LGF will be significantly improved. For example, improvements in transparency, light transmittance and thermal stability will make LGF more competitive in a wider range of application scenarios. At the same

time, the trend of thinness and flexibility will also drive LGF to develop in a smaller and more portable direction to meet the needs of future wearable devices and new electronic products. In addition, environmental protection and sustainable development are also important considerations for the future development of LGF. The increasing market demand for green materials has prompted LGF manufacturers to pay attention to the recycling of materials and the environmental impact of the production process. Therefore, the use of degradable materials and low-energy production processes will become an important trend in the future LGF industry. In terms of market competition, the LGF industry is experiencing a reshuffle. As more companies enter this field, product differentiation and brand building are becoming increasingly important. Companies need to continue to innovate in technology research and development, production efficiency, and cost control to maintain market competitiveness. At the same time, strategic cooperation and industrial chain integration will also become an important path for corporate development, through collaboration with upstream and downstream companies, jointly improving product value and market share.

The global Light Guide Film market size was estimated at USD 716.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.00% during the forecast period.
