Report Overview

Light naphtha is a volatile, low-boiling-point petroleum fraction derived from crude oil refining, typically with a boiling range between 30°C and 90°C. It consists primarily of C5-C6 hydrocarbons and is a key feedstock for petrochemical production, particularly in steam crackers for ethylene and propylene manufacturing. Due to its high paraffin content, it is also used as a blending component in gasoline and as a solvent in industrial applications. The product's specifications, such as low sulfur content and high octane number, make it valuable in refining and chemical processes. Its demand is closely tied to the petrochemical industry's growth, gasoline blending requirements, and regional refining capacities, with pricing influenced by crude oil dynamics, supply-demand imbalances, and regulatory standards on fuel quality.

The global Light Naphtha market size was estimated at USD 30033.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
