Abstracts

A light to frequency converter is an electronic device that transforms incident light intensity into a corresponding frequency output signal, typically utilizing a photodiode or phototransistor as the sensing element and an internal oscillator circuit to generate a frequency proportional to the detected light level. This conversion process enables straightforward interfacing with digital systems, such as microcontrollers or frequency counters, without the need for additional analog-to-digital converters, making it particularly valuable in applications requiring precise, noise-resistant light measurements, including optical encoders, ambient light sensing for display brightness control, colorimetry, and industrial automation systems where consistent and reliable light-to-digital signal translation is essential.

The global Light To Frequency Converter market size was estimated at USD 35.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
