Abstracts

A lightning impulse generator is a specialized high-voltage testing apparatus designed to simulate the electrical stresses caused by lightning strikes or switching surges on electrical equipment, such as transformers, insulators, circuit breakers, and power transmission components. It produces standardized impulse voltage waveforms typically with a rapid rise time (e.g., 1.2 microseconds) and a slower decay (e.g., 50 microseconds) to evaluate the insulation strength, dielectric performance, and overall robustness of devices under test, ensuring compliance with international standards like IEC 60060 and IEEE standards. These generators are essential in research laboratories, manufacturing quality control, and certification processes within the power generation, transmission, and distribution sectors, where verifying resilience against transient overvoltages is critical for operational safety and reliability.

The global Lightning Impulse Generator market size was estimated at USD 120.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
