Abstracts

A Lightning Protection Backup Protector is a crucial component in an overall lightning protection system. Its primary function is to provide an additional layer of safeguard in case the primary lightning protection device fails. These protectors are designed to divert the high - voltage surges induced by lightning strikes, whether they are direct or indirect, away from sensitive electrical and electronic equipment. They typically operate based on principles such as over - voltage clamping, where they limit the voltage across a protected circuit to a safe level. By having a backup protector, the risk of damage to valuable equipment, such as computers, telecommunications systems, and industrial control panels, is significantly reduced. This ensures the continuity of operations in various settings, from residential buildings to large - scale industrial facilities, by acting as a secondary line of defense against the potentially destructive effects of lightning - related electrical surges.

The global Lightning Protection Backup Protector market size was estimated at USD 492.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
