### Report Overview

Lightweight portable printers refer to portable thermal printers with a net weight of less than 800 grams. The working principle is that a semiconductor heating element is installed on the print head. After the print head is heated and contacted with the thermal printing paper, the required pattern can be printed. The principle is the same as Thermal fax machines are similar. The image is created by heating, creating a chemical reaction in the film. This thermal printer chemical reaction occurs at a certain temperature. High temperatures speed up this chemical reaction. When the temperature is below 60°C, the paper takes a long time, even several years, to turn dark; when the temperature is 200°C, this reaction is completed in a few microseconds.

The global Lightweight Portable Printers market size was estimated at USD 74.50 million in 2023 and is projected to reach USD 140.46 million by 2032, exhibiting a CAGR of 7.30% during the forecast period.
