Report Overview

The cornea is the eye's major protective barrier and accounts for approximately two-thirds of the eye's total refractive power. It consists of three layers that have different embryonic origins: the epithelial layer develops from the surface ectoderm, whereas the stroma and the endothelium origin from neural crest cells (mesenchymal tissue). Experimental studies have shown that diverse types of stem cells are located in each layer. Corneal blindness due to compromised corneal transparency is a major cause of blindness. In the past few years, intensive research has focused on corneal stem cells as a source of regenerative cell-based therapy.
