Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Line Pulling Swivels competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global line pulling swivel output reached about 7.8 million units against a total production capacity of roughly 9.5 million units, with average unit price USD 33, and manufacturers averaging a 29% gross margin. Line Pulling Swivels are mechanical connectors used in overhead line construction and underground cable installation to prevent twisting, binding, or torque transfer while pulling conductors, fiber-optic cables, or utility lines; they typically feature high-strength alloy steel or stainless-steel bodies, precision ball-bearing or tapered-roller mechanisms, and torque-balanced designs to ensure smooth rotation under high tensile loads. The supply chain begins with upstream raw materials such as alloy steels, stainless steels, heat-treating services, and precision-machined components, then moves to midstream manufacturing where CNC machining, heat treatment, surface finishing, and assembly of bearing systems produce finished swivels, before downstream integration by utility contractors, transmission line installers, telecom deployment firms, and distributors supplying power grid, rail, industrial, and fiber-optic installation projects.

The global Line Pulling Swivels market size was estimated at USD 265.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
