Report Overview:

Linear Accelerators (for Radiation) is a device that uses high Radio-Frequency (RF) electromagnetic waves to accelerate charged particles (i.e. electrons) to high energies in a linear path, inside a tube like structure called the accelerator waveguide. The resonating cavity frequency of the medical LINACs is about 3 billion Hertz (cycles/sec). This is the most common device to treat cancer with external beam radiation.

A linear accelerator (LINAC) customizes high energy x-rays or electrons to conform to a tumor's shape and destroy cancer cells while sparing surrounding normal tissue. It features several built-in safety measures to ensure that it will not deliver a higher dose than prescribed and is routinely checked by a medical physicist to ensure it is working properly.

The Global Linear Accelerators for Radiation Market Size was estimated at USD 4049.72 million in 2023 and is projected to reach USD 7019.21 million by 2029, exhibiting a CAGR of 9.60% during the forecast period.
