Abstracts

Linear diaphragm pumps, also known as AODD (Air-Operated Double Diaphragm) pumps, are positive displacement pumps that utilize compressed air to alternately flex two diaphragms, creating a reciprocating action that moves fluid through the pump with one diaphragm discharging while the other simultaneously fills. These pumps are characterized by their self-priming capability, ability to handle viscous fluids, slurries, and abrasives without damage, dry-run tolerance, and ease of maintenance due to a design with no seals or motors that can come into contact with the fluid. They are widely employed across industries such as chemicals, wastewater treatment, food and beverage, pharmaceuticals, and mining, where their leak-proof operation, versatility in handling diverse media, and explosion-proof nature (as they require no electricity) make them a preferred solution for transferring aggressive, sensitive, or hazardous liquids.

The global Linear Diaphragm Pumps market size was estimated at USD 450.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
