Abstracts

A linear displacement encoder is an accurate sensor used to measure the movement of an object in a straight line. It is commonly used in industrial automation, machining, and precision control systems. It provides accurate position information by converting the linear displacement of an object into an electronic signal. The working principle of a linear displacement encoder is based on sensing technology (such as optical, magnetic, or inductive). It usually consists of a fixed encoder part and a movable part that is connected to the object. As the object moves, the encoder will output a corresponding signal according to the change in the object's position.

The global Linear Displacement Encoder market size was estimated at USD 1103.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
