Report Overview

A Hall effect sensor is an electronic device designed to detect the Hall effect and convert its findings into electronic data to turn on or off circuits and provide measurements of changing magnetic fields that are processed by an embedded computer or displayed on an interface. Linear Hall sensors (simulations) make accurate and continuous measurements based on the strength of the magnetic field; They don't open and close. Within the Hall effect sensor, the Hall element sends the potential difference (the voltage generated by electromagnetic interference) to the amplifier so that the voltage change is large enough to be sensed by the embedded system.
