Abstracts

Linear magnetic Hall sensors are solid-state transducers that generate a voltage output proportional to the strength and polarity of an applied magnetic field, operating on the principle of the Hall effect where a potential difference is produced across an electrical conductor when subjected to a perpendicular magnetic field; these sensors are characterized by their ability to provide continuous, linear output signals that vary directly with the magnetic flux density, making them distinct from digital or switch-type Hall sensors which produce binary on/off outputs. They are widely utilized in applications requiring precise measurement of position, displacement, speed, and current in industries such as automotive (e.g., throttle position sensing, pedal positioning), industrial automation (e.g., linear actuators, motor control), consumer electronics (e.g., joysticks, potentiometer replacement), and medical devices (e.g., infusion pumps, ventilator controls), offering advantages like non-contact operation, high reliability, durability in harsh environments, and minimal wear and tear due to the absence of mechanical parts.

The global Linear Magnetic Hall Sensor market size was estimated at USD 850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
