Abstracts

A linear motor driver IC is an integrated circuit designed to control and drive linear motors, which are electromagnetic devices that produce motion in a straight line rather than rotational movement. Unlike traditional motor drivers, linear motor driver ICs provide precise control over the motor's position, velocity, and acceleration by managing current and voltage to the motor windings without the need for mechanical conversion components. These ICs typically incorporate features such as built-in amplifiers, protection circuits, and feedback mechanisms to ensure smooth, accurate, and efficient operation, making them essential in applications requiring high precision, such as semiconductor manufacturing equipment, medical devices, robotics, and automation systems where minimal friction, fast response times, and exact positional control are critical.

The global Linear Motor Driver Ic market size was estimated at USD 356.84 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.15% during the forecast period.
