Abstracts

A linear motor is a transmission device that converts electrical energy directly into linear motion mechanical energy without any intermediate conversion mechanism. It can be regarded as a rotating motor cut radially and unfolded into a plane. The linear motor with drive control technology is becoming more and more mature, with barriers that traditional equipment cannot surpass. With the continuous improvement of motor manufacturing technology, choosing matching linear motors and drive control systems can be more efficient. The linear motors in machine tools are becoming more and more mature and perfect with drive control technology, and have barriers that traditional devices cannot surpass. With the increasing improvement of motor manufacturing technology today, choose matching linear motors and drive control systems, cooperate with reasonable machine tool configuration, and high-performance machine tools. In recent years, even though various countries have further strengthened the scale and structure characteristics of production, they still cannot meet the huge supply of the market. With a strong market scale, one-third of the world's CNC will be driven by linear motors in the next few decades, and the use of high-end machine tools will undoubtedly account for a large proportion.

The global Linear Motor market size was estimated at USD 723.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.00% during the forecast period.
