## Abstracts

A linear to circular polarizer is an optical filter that converts linearly polarized light into circularly polarized light, achieved by introducing a quarter-wave phase shift between the orthogonal components of the incoming linearly polarized beam; this device is critical in applications such as stereoscopic 3D imaging, liquid crystal displays (LCDs), optical communications, and photography, where circular polarization mitigates issues like glare, reflection, and orientation sensitivity, enhancing contrast, reducing eye strain, and improving signal integrity in various optical and electronic systems.

The global Linear To Circular Polarizer market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
