Abstracts

Lipid injectable emulsions are sterile, non-pyrogenic fat emulsions designed for intravenous administration, primarily serving as a vital source of essential fatty acids and a concentrated caloric supply in parenteral nutrition for patients who are unable to obtain adequate nutrition through oral or enteral routes. Composed of refined vegetable oils (such as soybean, safflower, or olive oil), emulsified with egg phospholipids and stabilized with glycerin, these formulations provide a source of long-chain triglycerides (LCTs) and, in some advanced formulations, a combination of medium-chain triglycerides (MCTs) to optimize metabolic efficiency and reduce complications associated with pure LCT-based emulsions. They play a critical role in clinical settings by preventing or correcting essential fatty acid deficiency and supporting energy requirements in critically ill, surgical, or malnourished patients, with their composition and infusion protocols carefully tailored to individual metabolic needs and tolerance.

The global Lipid Injectable Emulsion market size was estimated at USD 2246.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
