In 2024, global Lipofilling Cannulas production reached approximately 5,219 k units, with an average global market price of around US\$ 16.5 per unit. In 2024, the global 's total production capacity of Lipofilling Cannulas reached 6,800 k units. The industry average gross profit margin of this product reached 31%. A lipofilling cannula is a medical device used in fat transfer procedures to both harvest and inject fat. They are specifically designed to be minimally traumatic to the tissue and fragile fat cells, often featuring blunt tips, smooth surfaces, and a low-pressure system for extraction and injection. Some cannulas are single-use to prevent cross-contamination, while others vary in size, flexibility, and tip design depending on the specific application, like facial or body sculpting. Upstream biological raw materials mainly include hyaluronic acid (HA), recombinant collagen, poly-L-lactic acid (PLLA), polycaprolactone (PCL), deoxycholic acid, etc. Midstream product manufacturing involves hyaluronic acid fillers, collagen fillers, regenerative material fillers, lipolysis injections, etc. Downstream sales channels include public hospitals, private medical beauty chain institutions, etc. Current technological development has evolved from a simple "filling" function to an emphasis on "regeneration," "shaping," and "skin quality improvement." In addition to traditional HA, new materials such as recombinant collagen, regenerative materials (such as poly-L-lactic acid and polycaprolactone), and lipolysis injections are becoming R&D hotspots and market growth points.

The global Lipofilling Cannulas market size was estimated at USD 86.11 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.40% during the
