Report Overview:

Liposuction, also referred to as lipoplasty, involves a cosmetic surgery which slims and reshapes specific parts of the body by removing excess fat deposits, improving your body contours and proportion. This surgery breaks up and 'sucks' fat from different possible parts like thighs, hips and buttocks, abdomen and waist, cheeks, chin and neck, upper and back of the arms, inner knee, chest area, calves and back. The fat is removed through a hollow instrument, called a cannula which is inserted under the skin. A powerful high pressure vacuum is applied to the cannula. Liposuction is often combined with other plastic surgery procedures like facelift, abdominoplasty (tummy tuck surgery) and breast reduction and performed. It can permanently remove the fat cells and can alter the shape of the body. Liposuction will not get rid of cellulite or stretch marks. It will help in avoiding obesity and as a result getting rid of related diseases. Liposuction was invented in 1972 by two Italian-American surgeons- Doctors Giorgio and Arpad Fischer. However modern liposuction started with a presentation in 1982 by Dr. Yves-Gerard Illouz, a French surgeon.

The Global Liposuction Surgical Procedures Market Size was estimated at USD 6153.31 million in 2023 and is projected to reach USD 9286.36 million by 2029, exhibiting a CAGR of 7.10% during the forecast period.
