Report Overview

The term 'liquid chromatography' basically refers to a chromatographic technique for separating ions or molecules that are dissolved in a solvent. It entails the separation of biomolecules based on their size, type, and other characteristics, and it necessitates the use of stationary phase, mobile phase, and elutants to complete the separation technique. Because of the different speeds at which each ingredient travels, the approach is extremely useful for separating and detecting many constituents from a combination. The simple liquid chromatography generally consists of a column with a fritted bottom that basically maintains a motionless phase in equilibrium with a solvent, while the complex liquid chromatography consists of a column with a fritted bottom that holds a motionless phase in equilibrium with a solvent.
