Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Liquid Column Manometer competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of liquid column pressure gauges will be approximately 150,000 units, with an average selling price of US\$705 per unit. A liquid column manometer is a device that measures pressure by observing the height difference of a liquid column in a tube. It's a simple yet reliable instrument used for measuring vacuum, pressure, and differential pressure. The basic principle involves a U-shaped tube filled with a liquid, where one side is connected to the pressure source and the other to a reference pressure, like atmospheric pressure or a vacuum. The difference in liquid levels directly corresponds to the pressure difference. The upstream of the liquid column manometer industry chain includes manufacturers of glass tubes, silicone oil, mercury, alcohol, rubber seals, and stainless steel interfaces. Major suppliers include SCHOTT (Germany), 3M, Dow Chemical, and Toray Industries. Downstream applications are concentrated in HVAC engineering, gas transmission and distribution systems, chemical environmental monitoring, and laboratory calibration institutions. Industrial field monitoring and gas pipeline network testing account for over 60%, while universities and research laboratories account for approximately 20%. Industry development trends are towards digitalization, environmental friendliness, and high sensitivity. Traditional mercury liquid columns are gradually being phased out due to environmental policies, replaced by safer liquids such as alcohol and silicone oil. The combination of digital liquid column pressure gauges and differential pressure sensors automates readings, reduces errors, and meets the demands for high precision and remote monitoring. Driving factors include industrial automation upgrades, improved gas transmission and distribution and HVAC testing standards, increased demand from education and

research institutions, and environmental regulations driving product updates. Obstacles mainly include liquid evaporation, high temperature sensitivity, large human error in readings, and the pressure from declining costs of digital alternatives on traditional products. In terms of annual production capacity per production line, small and medium-sized enterprises typically produce 20,000 to 40,000 units, while large manufacturers can produce 80,000 to 120,000 units. The gross profit margin of traditional liquid column pressure gauges is approximately 25% to 30%, while the gross profit margin of high-end products using digital displays and new liquids can reach 40%.

The global Liquid Column Manometer market size was estimated at USD 107.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
