Abstracts

Liquid cooled charging piles are advanced electric vehicle (EV) charging systems that utilize a liquid-based cooling mechanism?typically a dielectric coolant?to manage the intense heat generated during high-power DC fast charging, enabling power outputs often exceeding 350kW and significantly reducing charging times compared to conventional air-cooled alternatives. By circulating coolant through cables, connectors, and internal electronic components, these systems maintain optimal operating temperatures, enhance safety by minimizing overheating risks, improve energy efficiency, and allow for slimmer, more flexible charging cables that are easier for users to handle. This technology addresses critical bottlenecks in EV adoption?such as range anxiety and long waiting times?by supporting ultra-fast charging infrastructure necessary for the next generation of high-capacity electric vehicles, making it a cornerstone of future-ready EV ecosystems.

The global Liquid Cooled Charging Pile market size was estimated at USD 1450.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 18.50% during the forecast period.
