Report Overview

Liquid cooled servers use working fluid as a medium for intermediate heat transfer to transfer heat from hot areas to distant locations for cooling. Since the specific heat of liquid is much greater than that of air, the heat dissipation speed is much greater than that of air, so the cooling efficiency is much higher than that of air cooling. Since the fan is omitted, the noise can also be reduced. Future generations of servers may require liquid cooling as air cooling capacity is exceeded.

The global Liquid Cooled General Purpose Server market size was estimated at USD 5862 million in 2023 and is projected to reach USD 56787.50 million by 2032, exhibiting a CAGR of 28.70% during the forecast period.
