Abstracts

Liquid cooled servers use working fluid as a medium for intermediate heat transfer to transfer heat from hot areas to distant locations for cooling. Since the specific heat of liquid is much greater than that of air, the heat dissipation speed is much greater than that of air, so the cooling efficiency is much higher than that of air cooling. Since the fan is omitted, the noise can also be reduced. Future generations of servers may require liquid cooling as air cooling capacity is exceeded.

The global Liquid Cooled General Purpose Server market size was estimated at USD 11770.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 28.70% during the forecast period.
