Abstracts

Liquid Core Optical Fiber (LCOF) refers to a specialized type of optical fiber where the core—typically composed of a high-refractive-index liquid such as water, organic solvents, or engineered fluids—is surrounded by a solid cladding material, often a low-index polymer or silica glass. Unlike conventional solid-core fibers, LCOFs leverage the unique optical properties of liquids, including tunable refractive indices, enhanced nonlinear optical responses, and the ability to integrate functionalized or active media directly into the light-guiding region. This design enables applications requiring high-power transmission, sensing of chemical or biological analytes, and dynamic control over light propagation, making LCOFs distinct in their flexibility and functionality compared to traditional optical fibers.

The global Liquid Core Optical Fiber market size was estimated at USD 250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
