Report Overview

The liquid helium generator is a device that converts liquid helium into helium gas. Liquid helium is produced at a low temperature of 4.2k. Therefore, its low temperature conditions are suitable for the research needs of superconductors, low temperature physics and material properties.

The process of helium liquefaction is to compress the helium gas and enter the liquefaction machine through the impurity adsorber. It is first pre-cooled by liquid nitrogen, and then compressed by five heat exchangers and two expansion engines. The temperature is gradually reduced to a temperature of 6k to 18k through the JT valve. It is converted into liquid helium, and this cooling process takes 3 to 4 hours to reach the working temperature.
