Report Overview

The liquid-liquid coalescing separator is mainly designed for liquid-liquid separation, and it contains two kinds of filter elements, namely: a coalescence filter element and a separation filter element. For example, in the oil dewatering system, after the oil flows into the coalescing separator, it first flows through the coalescing filter element. The coalescing filter element filters out solid impurities and coalesces extremely small water droplets into larger water droplets. Most of the coalesced water droplets can be separated and removed from the oil by their own weight and settled into the sump. Then the oil product flows through the separation filter element. Since the separation filter element has good lipophilic and hydrophobic properties, the water is further separated, and finally, the clean, anhydrous oil product flows out of the coalescing separator.

The global Liquid Liquid Coalescing Separator market size was estimated at USD 285.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.85% during the forecast period.
