Abstracts

Liquid metal 3D printing refers to an additive manufacturing process that utilizes metals with low melting points, such as gallium-based alloys, bismuth, or indium, which remain in a liquid state at or near room temperature, enabling deposition and solidification without the extreme heat requirements of traditional metal 3D printing; this technology operates through methods like direct ink writing, syringe extrusion, or electrohydrodynamic printing, allowing for the creation of intricate, flexible, and conductive structures with applications in soft robotics, wearable electronics, biomedical implants, and rapid prototyping, where conventional high-temperature processes would be impractical or damaging to sensitive components.

The global Liquid Metal 3D Printer market size was estimated at USD 78.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 22.65% during the forecast period.
