Abstracts

Liquid Organic Hydrogen Carrier (LOHC) technologies provide an effective alternative solution by chemically bonding hydrogen to a stable organic liquid carrier, thereby eliminating the need for compression and making it safer, more practical and more cost-efficient to transport hydrogen using existing conventional fuel networks. From the perspective of technological development direction, high-pressure gaseous hydrogen storage technology is currently relatively mature and will be the main hydrogen storage technology for a certain period of time. As LOHC technology matures, there is a push towards commercialization with the development of pilot projects, demonstration plants, and partnerships between companies to bring LOHC systems to market. Liquid and solid hydrogen storage efficiency is higher than gaseous hydrogen storage, which is the future development direction. At present, organic liquid hydrogen storage and solid hydrogen storage are still in the research stage or demonstration stage in many countries. Organic liquid hydrogen storage technology has unique safety and transportation convenience. However, this technology still has many technical problems and will have great application prospects in the future. Many governments around the world are implementing policies and providing incentives to promote the use of hydrogen as part of their sustainable energy transition strategies. This has created a favorable environment for the adoption of LOHC technology.

The global Liquid Organic Hydrogen Carrier (LOHC) Technology market size was estimated at USD 230.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 30.10% during the forecast period.
