Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Liquid-phase Precursor competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A Liquid-phase Precursor is a chemical compound dissolved or suspended in a liquid medium that serves as the source material for forming thin films, nanoparticles, or solid compounds through processes such as sol-gel synthesis, chemical vapor deposition (CVD), atomic layer deposition (ALD), or solution processing. It provides controlled reactivity and uniform mixing at the molecular level, enabling precise stoichiometry and high purity in the resulting material. The supply chain of liquid-phase precursors typically begins with upstream producers of metal-organic compounds, halides, or alkoxides (e.g., titanium, aluminum, or silicon precursors), which are formulated and purified by specialty chemical manufacturers. Midstream suppliers handle packaging, stabilization, and quality assurance to meet semiconductor, coating, or energy storage industry standards. Downstream, these precursors are delivered to device manufacturers, coating firms, and research institutions that use them in high-value applications such as thin-film transistors, catalysts, photovoltaics, ceramics, and nanomaterials production. In 2024, global Liquid-phase Precursor output reached 42,000 tons with a capacity of 52,000 tons, priced at USD 43,000-95,000 per ton depending on purity and volatility, achieving an average gross margin of 39%.

The global Liquid-phase Precursor market size was estimated at USD 2657.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.20% during the forecast period.
