## Abstracts

Liquid polyaluminum chloride (LPAC) is an inorganic polymer coagulant widely used in water and wastewater treatment processes, characterized by its high cationic charge density and polymeric structure that enables efficient removal of suspended solids, colloidal particles, and organic matter through charge neutralization, adsorption, and bridging mechanisms. It is typically produced by partially neutralizing aluminum chloride solutions with bases such as sodium carbonate or calcium hydroxide, resulting in a product with variable basicity and molecular weight distributions optimized for different water quality conditions and treatment objectives. Compared to traditional coagulants like alum or ferric chloride, LPAC offers advantages such as broader pH applicability, lower dosage requirements, reduced sludge production, and improved settling characteristics, making it particularly suitable for treating surface water, industrial effluents, and municipal sewage where enhanced turbidity removal, color reduction, and phosphorus elimination are critical. Its liquid form facilitates easier handling, storage, and automated dosing in treatment plants, though it requires corrosion-resistant equipment and careful stability management to prevent precipitation or efficacy loss over time.

The global Liquid Polyaluminum Chloride market size was estimated at USD 620.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
