Abstracts

Liquid Silicone Injection Moulding (LIM) is a specialized manufacturing process that utilizes liquid silicone rubber (LSR) to produce high-precision, durable, and flexible components. LIM involves injecting liquid silicone rubber (a two-component material, typically consisting of a base polymer and a curing agent) into a heated mold under high pressure. The material cures chemically (via addition curing) at the mold temperature, forming a solid elastomeric product. The process is highly automated, reducing labor costs and improving production efficiency (e.g., continuous batch processing). Enables complex geometries, thin walls (as low as 0.1 mm), and tight tolerances (e.g., ± 0.05 mm), ideal for micro-molded parts. LSR cures without by-products (e.g., no gas evolution), minimizing defects and scrap. LSR is non-toxic, recyclable, and compliant with strict environmental standards (e.g., RoHS, REACH). Suitable for both small-batch and high-volume production, with molds designed for long service life (up to millions of cycles).

The global Liquid Silicone Injection Moulding (LIM) market size was estimated at USD 1386.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
